Weigner, Jaromír, Docent, Engineer, Doctor, Rudolf Barta, Professor, Engineer, Doctor, Doctor of Technical Sciences, and Josef Koritta, Professor, Engineer, Doctor.

Průmysl anorganickochemický, silikátový a metalurgie (Industry of Inorganic Chemistry, Silicates, and Metallurgy) Prague, SNTL, 1960. 333 p. (Series: Obecná chemická technologie, 1) 3,200 copies printed.

Reviewers: Mikulas Gregor, Professor, Engineer, Doctor, František Kanhaüser, Professor, Engineer, Doctor, and Albert Regner, Professor, Engineer, Doctor. Tech. Ed.: Marie Králová. Chief Ed.: Adolf Balada, Doctor. Resp. Ed.: Jindřich Šob, Engineer.

PURPOSE: This book is intended for chemical engineers and technicians working in the chemical industry, and for students enrolled in higher schools of technology.

COVERAGE: The book surveys the principal processes used in the production of inorganic chemicals, in the technology of silicates, and in the chemical technology of metals. It has been approved by decree of the Ministerstvo

Card 1/15

## Industry of Inorganic Chemistry, Silicates, and Metallurgy CZECH/5253

skolství a kultury (Ministry of Education and Culture) as a textbook for higher schools of chemical engineering and chemical technology. This is the first of five volumes to be published under the general title Obecná Chemická Technologie (Modern Chemical Technology) and deals with those branches of the chemical industry whose base is inorganic chemistry, including, therefore, the silicate chemicals industry and metallurgy. The theoretical basis for each process discussed is explained, and descriptions of the raw material used and of the finished product provided. Subsequent volumes of the series will deal with the technologies of organic chemistry, fuels, water, the food and brewing industries. The following personalities are mentioned: Professor Doctor M. Gregor, Engineer; Professor Doctor F. Kanhäuser, Engineer; Professor Doctor Regner, Engineer; and Engineer S. Havel, and L. Koritta. References accompany each chapter.

Preparation of diallyl phthalate by azeotropic esterification. J. A. Weigner, Vl. Kudlacek, J. Baca, and St. Havel (Vysoka škola chem.-tech., Pardubice, Czech.). Chem. prumysl 8/33, 339-43 (1958).—The course of the prepn. of diallyl phthalate from phthalic anhydride and allyl alc. was studied by varying the amt. of catalyst, temp. of the azeotropic distn., type of catalyst, and molar ratio of reactants. The reaction rate increased with increasing amts. of catalyst and with increasing temp. of the distn. Of the

solvents tested xylene was superior to PhMe or C<sub>6</sub>H<sub>6</sub> because of its higher b.p. H<sub>2</sub>SO<sub>4</sub> was a better catalyst than toluenesulfonic acid or Kater FN, an ion-exchange resin. The mole ratio of the reactants had only a minor effect on the rate. Optimum conditions for the esterification were equimolar quantities of allyl alc. and phthalic anhydride, 0.5% H<sub>2</sub>SO<sub>4</sub> as catalyst, and xylene as azeotropic agent yielding 81% product. The product, purified by treatment with 25% NaOH followed by vacuum distn., b<sub>1</sub> 147-50°. Max Hellmann

Chlorination of commercial divinylacetylene. Jaromír,  
A. Weigner, Stanislav Havel, and Vladimír Kudláček  
(Vysoká škola chem. technolog., Pardubice, Czech.).  
*Chem. průmysl* 9, 281-5 (1959).—Distr. tech. divinyl-  
acetylene (I) (39.1 g.) was chlorinated 2-11 hrs. (Cl dried  
by concd.  $H_2SO_4$ ) at 0-60° at a speed by which 2 moles of Cl  
was consumed during the first 2 hrs. The dissolved Cl was  
driven out from the reaction mixt. by N at 50°. The  
product contained the most Cl (72%) after 11 hrs. chlorina-  
tion at 0°. By distn. at 5-10 mm. a product contg.  
76% Cl was obtained. I (30 g.) was chlorinated 6-12 hrs.  
at 120-180° with 23 l. Cl per hr. The max. content of Cl  
(79.5%) was reached at 180° after 6 hrs. The use of 0.5%  
 $FeCl_3$  or  $PCl_5$  as a catalyst neither accelerated chlorination  
nor raised the content of Cl in the product. Chlorination  
products with varying content of Cl did not have pesticidal  
activity. I (122 g.) after chlorination at low temp. gave a  
product contg. 73.1% Cl, which was chlorinated 4 hrs. at  
140° and 20 l. Cl per hr. to give 1,2,3,3,4,4,5,6-octachloro-  
hexane, in 130-1° (3:2  $CHCl_3$ -EtOH). P. Čefalov

TITLE: The Oxidation of Phenanthrene With Peracetic Acid

PERIODICAL: Chemický průmysl, 1960, Nr 1, pp 10-16

ABSTRACT: The authors have studied the production of diphenic acid by oxidation of technical phenanthrene with peracetic acid, prepared in situ from hydrogen peroxide and glacial acetic acid. They have investigated different factors affecting yields and have attempted an interpretation of the reaction mechanism. In their studies they have followed closely experimental details given by O'Connor and Marriconi (Ref 20) who were the first to prepare diphenic acid in good yields by a one stage oxidation from phenanthrene. The oxidation medium in the present paper was 70.1% hydrogen peroxide in a solution of glacial acetic acid in presence of sulphuric acid as a catalyst. The molar proportion of hydrogen peroxide to phenanthrene was 14:1, oxidation time 3 hours at 90°C. Diphenic acid was obtained in a 74% yield calculated on the phenanthrene content of crude phenanthrene. 4

### The Oxidation of Phenanthrene With Peracetic Acid

The mechanism of the reaction is given as follows:

Step Nr 1. Oxidation of phenanthrene to 9,10-epoxy-9,10-dihydrophenanthrene. The authors have proved that the oxidant was the peracetic acid and not hydrogen peroxide.

Step Nr 2. Hydrolysis to 9,10-dihydroxy,9,10-dihydrophenanthrene.

Step Nr 3. Oxidation to phenanthraquinone. The oxidants in this step may be either peracetic acid or hydrogen peroxide.

Step Nr 4. Oxidation to diphenic acid. This proceeds according to the well known oxidation of  $\alpha$ -quinones to di-carboxylic acids by means of peracids. It is suggested that diphenic acid may find applications in the field of macromolecular chemistry e.g. for the preparation of polyamides, alkyd resins by reaction with glycerol, for the production of polyesters and for plasticisers.

These polymeric materials should be particularly suitable

The oxidation of phenanthrene with peracetic acid.  
Stanislav Jíável and Jaromír A. Weigner (Vysoká škola chem. technol., Pardubice, Czech.). *Chem. průmysl* 10, 10-16 (1960).—Phenanthrene (I) 76% in AcOH with H<sub>2</sub>SO<sub>4</sub> was oxidized with H<sub>2</sub>O<sub>2</sub> (II) under varying conditions: molar ratio of I to AcOH and II, the concn. of II, and the temp. were changed; control samples had the same compn. but contained no I. The decrease of II and peracetic acid (III) was observed in both samples. The mixt. was then poured into the same vol. of ice water to form an orange-yellow solid; a 25% soln. of NaOH was added, the whole filtered, and 50% H<sub>2</sub>SO<sub>4</sub> added to the soln. to give solid diphenic acid (IV), m. 110°. The product was washed with ice water and dried at 110°. A max. yield of IV was obtained under the following conditions: concn. of II 70.1%, mol. ratio AcOH-II-I 14:14:1, 90°, 3 hrs.; yield was 74% of 99.9% pure IV (calcd. on pure I). To 3 g. 98.7% I in 100 cc. dry dioxane at 70 or 90° was added 50 g. 54.2% II and 1.5 g. H<sub>2</sub>SO<sub>4</sub>, and the reaction progress checked by periodically taking samples. It was found that the decrease in II in this mixt. and in the control sample (without I) was the same and I was not oxidized with II under these conditions; the presence of III was necessary in the 1st step of oxidn. I (3 g.) (98.7%) was oxidized with 30 cc. 0.68M soln. of perbenzoic acid (V) in dry CHCl at 25°; a control sample contg. a 0.68M soln. of V was run together, and the decrease of V in both samples estd. by iodometric titration. After 120 hrs. when all the V present had reacted with I, CHCl was removed from the mixt. by distn. at 25-30 mm., and the yellow solid residue dissolved in dry dioxane. The presence of epoxy-groups in the product was proved with HIO<sub>4</sub>. Thus, in the 1st step I was oxidized with org. per-acids to 9,10-epoxy-9,10-dihydrophenanthrene, which was not isolated; this hydrolyzed with AcOH to 9,10-phenanthrenequinone (VI). VI could be oxidized with II to give IV.

TITLE: Equipment for continuously pressing and granulating loose materials

PERIODICAL: Referativnyy zhurnal, o'xdel'nyy vypusk, 47. Khimicheskoye i kholognoye mashinostroyeniye, no. 1, 1963, 68, abstract 1.47.475 P  
(Pol. pat., cl. 39d, 19/01, no. 45389, February 20, 1961)

TEXT: The patented equipment (see Figure) consists of two rolls rotating in opposite directions and driven by a gear-wheel transmission. On the surface of the rolls, there are grooves and projections disposed in such a way that the projections of one roll engage the grooves of the other. On the projections there are lateral cogs. Over the rolls, container 2 is installed for the supply of the loose material. The rolls are pressed together and the mass is cut with the cogs securing stretching of the mass tape between the rolls thus preventing its slip. From the periphery of the rolls, scrapers 3 were fixed in order to remove from the grooves the slices 4 which are passed to the container 5. In dependence on the size of the projections and grooves, and also on the distribu-

57. Based on Soviet experiences Hungarian research provides the printing industry with improved inking rollers - Kutatasunk szovjet tapasztalatok felhasznalaval jo ferteles hengereket ad a nyomdaiparnak - by V. Gulyas, E. Weil and B. Banyai (Paper and Printing - Papir- es Nyomdatechnika - Vol. 3, No. 2, pp. 26-29, Feb. 1951, 1 tab.)

On the basis of Soviet experiences researches were performed with three new types of roller materials: (1) natural rubber softened to a great degree with softening agents. This has the drawback that when cleaning the roller in petrol or kerosene or even in printing ink it swells excessively. (2) An oilproof synthetic rubber (neoprene), which swells less. This material, however, separates from the hard rubber binding layer underneath when treated with petrol. (3) A petrolproof synthetic rubber (of the pertungan type) did not prove entirely satisfactory in practice. Further investigations showed very good results with PVC base rollers. These rollers, which have proven excellent in a two-month plant test, are resistant to petrol, benzol, kerosene, turpentine, printing ink varnishes and oil. Further experiments are still necessary in order to produce PVC roller materials on a large scale with the casting techniques applied at present.

"The Importance of Routine X-Ray Examination of the Appendix in the Differential Diagnosis of Chronic Appendicitis in Cases of Colitis or Other Abdominal Symptoms."

Budapest, Magyar Radiologia, Vol XV, No 1, Jan 1963, pages 1-8.

Abstract: [Author's English summary modified] Based on 12 cases verified by surgery, the X-ray symptoms of chronic appendicitis are summarized and the importance of X-ray examination with contrast material of the appendix and the ileo-cecal region is stressed. The author observes that chronic appendicitis is often accompanied by regional colitis in the descending colon and sigma. In many cases appendicitis is hidden behind a clinical picture of colitis or of uncertain abdominal pain, the surgical treatment of which often eliminates abdominal pains of many years duration. SOURCE: Kiserletes orvostudomany, v. 1', no. 6, 1965, 611-614

TOPIC TAGS: rabbit, drug effect, reflex activity, toxin

ABSTRACT: The initial administration of S. typhi endotoxin regularly for a week  
prolongs the life of the animals suffering from pyrogenic shock and the elicitability  
of the carotid sinus reflex in its original intensity. The authors thank Doctor  
Ujhelyi Karoly, OKI, for providing the preparations, Zsuzsa Szathmary provided  
technical assistance. Orig. art. has: 2 figures and 1 table. [JPRS]

6. Construction  
of dams  
in Hungary - 1956

Gully control dams were built in 1957 at Vics and in 1959 at Fecel. During and after the construction of these dams, which can be seen as drop inlets and water from the gully of the dam can be entirely silted up, it is advisable to consider the reduction of the design flood discharge. The Hydraulic Research Institute is conducting experiments on the discharge capacity of culverts with drop inlets. For earth填土 dams a mixture of 35-40% clay and 60-65% sand is most suitable. The permeability of the soil in the back of the dam has decreased in both cases within 2-3 years due to the sealing effect of silt. The investigations on economy in respect to Hungarian conditions have shown that gully check dams with crowns exceeding 8 m length can be built most economically from earth. If the crown length is less than 8 m, the costs of earth-fill or rock-fill dams do not differ appreciably.

"Successful Surgery of Gastrochisis."

Budapest, Magyar Sebeszet, Vol XVI, No 3, June 1963, pages 192-195.

Abstract: [Authors' German summary] The authors report a case of gastrochisis which was successfully corrected by surgery. The prolapse of the small and large intestines which, for four hours, protruded on the right side of the navel was replaced into the abdomen and the abdominal wall was closed successfully. From the 14 cases reported in the literature, this is the sixth patient who survived. 1 Eastern European, 7 Western references.

19. Latest results of geological surveys in the Komló coal region - A Komlói feltámadt kohászok legújabb eredményei - Gy. Wein, (Journal of Geology - Földtan Közlöny - Vol. 41, 1953, No. 16-17, pp. 337-343, 1 fig., 1 tab., 1 map).

The hitherto unsolved problems of seam identification and structure were clarified to a large extent by the latest geological researches in the Komló coalfields. The Lower Elassic coal bearing zone at Komló has 99 seams exceeding 5 cm in thickness in a height of succession ranging from 430 to 500 m. Among the three zones of productive strata the underlying ones do not contain workable veins; the thickest seams may be found in the middle, whereas in the upper only thin seams of high-grade coal may be found. The calorific value of the coal amounts to approximately 6000 cal. The vein-like penetration of the erratically settled trachydolerite and phonolite into the Lower Cretaceous (Hauterivien) often cokes and even dissolves coal seams. Recent researches have proven that the middle mining field was pushed onto the West field along a steep line. Mining was therefore directed towards the fault bench which had been considered rubbish. The East mining field is separated from the middle field by the South main fault. As indicated by the structural conditions, coal formations suffered corrugation previous to the Miocene, and the middle-Miocenic successions were discordantly superimposed on the latter. Ulterior tectonic movements are no longer distinguishable. Gy. Wein

"Modified Synthesis of 2-Methyl-4-Amino-5-Ethoxymethyl-Pyrimidine," G. Podor, A. Gerecs, I. Kiss, J. Folonics, J. Wein, E. Kovacs, Inst of Org Chem, Szeged State U; Sci Res Lab, "Chinoin" Plant, Hungary

"Zhur Obshch Khim" Vol XXI, No 10, pp 1897-1902

Synthesized 2-methyl-4-amino-5-ethoxymethyl-pyrimidine, one of chief intermediate products in prepn of aneurine, by Chelintsev method which, based on esters of enols as ~~starting~~ materials, was extended to enol others. By this method closing of pyrimidine ring, difficult and time-consuming in usual method, was carried out in one stage with use of 1 mole of acetamidine.

Formation of 2-phenyl-4-benzylidene-5(4H)-oxazolone from phenylserine ethyl ester during the Schotten-Baumann acylation. János Wein and Géza Benkó (Univ. Szeged, Hung.). *Magyar Kém. Folyóirat* **57**, 40-51 (1951).  
Phenylserine *Rt* ester in abs.  $\text{BzOH}$  was hydrogenated 7 hrs. under 120 atm. pressure at 50° in the presence of W-1 Raheys-Ni catalyst with vigorous shaking. No cryst. products could be obtained from the thick, brown oil formed. When this oil was benzoylated at 35-40° by the Schotten-Baumann reaction with  $\text{BzCl}$  in an alk. medium with stirring, a yellow cryst. substance was obtained which proved to be 2-phenyl-4-benzylidene-5(4H)-oxazolone (I), m. 159-160°. Obviously the unchanged amino ester underwent a double condensation. The reaction is explained by the instability of the oxazoline deriv. formed primarily and the removal of the OH group in the  $\alpha$ -position forming a system with conjugated bonds and increasing the stability. The fact that I was formed in place of  $\text{PhCH}(\text{OHCCH}_2\text{NH}_2)\text{CH}_2\text{COOH}$  is probably a result of the high thermochem. stability of 4-benzylidene-5(4H)-oxazolone deriv. 1. Finally

Synthesis of poly-L-glutamic acid. C. Borchardt, J. Wein, H. Nagy, M. Koller, J. L. Kornblum, and R. L. Koenig. *J. Am. Chem. Soc.* 77, 11200 (1955). No improvement is claimed over the former method of *N*-(*L*-178)-amino-*D,L*-glutamate (*C.A.* 49, 108334) which was treated through mixed anhydride formation, hydrolysis, and polymerization. Continual removal of  $\text{CO}_2$  formed in the reaction mixture is claimed. In the mixed anhydride, the carboxyl group is used to give a complex in which the  $\text{NH}_2$  group is made and subsequently polymerized. The *N*-*D,L*-amino acid is used. It is treated with  $\text{PbSH}_2$ . The product is polymerizable in hot water. The polymer, the *L*-polymer, is obtained through  $\text{CuCl}$  as a co-catalyst. It gives no buffer reaction, much like natural D,L-glutamic acid.

acid. C. Borchardt, J. Wein, H. Nagy, M. Koller, J. L. Kornblum, and R. L. Koenig. *J. Am. Chem. Soc.* 77, 11200 (1955). Cf. preceding article. The conversion of *d,L*-Me<sub>2</sub>*D,L*-glutamate to (*D,L*-*L*-*D,L*-glutamate) is claimed. The benzoylated intermediate is formed. The benzoylated intermediate is converted to (*D,L*-*L*-*D,L*-glutamate) by hydrolysis.  $\text{HCOONa}$  is added to the reaction mixture. In addition,  $\text{PbSH}_2$  is added. A salt is formed. The salt is washed with water and dried. The salt is polymerized. In a separate synthesis, *N*-*D,L*-amino-*D,L*-glutamate (*C.A.* 49, 108334) is converted to (*D,L*-*L*-*D,L*-glutamate) by hydrolysis. The product is polymerizable in hot water. The polymer is obtained through  $\text{CuCl}$  as a co-catalyst. It gives no buffer reaction, much like natural D,L-glutamic acid.

Title : Effect of the Bulk of the Acylated Basic Group on  
the Rate of the N → O Migration of the Acyl Group  
in Ephedrine and Pseudoephedrine  
Orig Pub. : Acta Chim Acad Sci Hung, 17, No 2, 189-200 (1958)  
  
Abstract : It has been found that in N-alkyl derivatives  
of N-benzoylephedrine (I) (erythro-series) the  
rate of the N → O migration of the acyl group  
(MAG) increases with increasing bulk of the  
alkyl group in the series I < N-benzoylephedrine  
< N-ethyl-I (II) < N-isopropyl-I (III). In the  
threo-series the rate of MAG varies in the in-  
verse order, i.e., N-benzoylpseudonorephedrine < N-  
ethyl-N-benzoylpseudonorephedrine (IV) < N-iso-  
propyl-N-benzoylpseudonorephedrine (V) < N-benzoyl-  
pseudonorephedrine. The results obtained are in

3345. THE USE OF FORMOL-TREATED ERYTHROCYTES AS ANTIGEN CARRIERS IN INDIRECT HAEMAGGLUTINATION. I. - Die Verwendbarkeit formol-behandelter Erythrocyten als Antigenträger in der indirekten Haemagglutination. I. Mitteilung - Weinbach R. Serum- und Impfstoff-Inst., 'I. Cantacuzino', Bukarest - SCHWEIZ. Z. ALLG. PATH. 1958, 21/6 (1043-1052)

A description is given of a method for the treatment of sheep and human erythrocytes with formal which is suitable for their fixation so that they can be stored for a long time. The formal imparts to them characteristic qualities by which they become more suitable for the indirect haemagglutination test.

Tables 6

Comparative tests in 20 human sera showed that absorption with boiled rabbit, bovine and sheep erythrocytes provided a better differentiation of sheep red cell agglutinins than the customary absorption with guinea-pig kidney and boiled bovine erythrocytes. A study of the relationship between the blood group of the ABO-system and sheep cell agglutinins in 89 human sera indicated that sheep cell agglutinins were less frequent in blood group A sera than in blood group O or B sera. The findings are discussed and the possibility of antigenic similarity of the mononucleosis antigen (and possibly other sheep cell antigens as well) and blood group A substance is mentioned.
